Kyiv, Ukraine · Remote / Hybrid
Full-time / Part-time

TECHNICAL SKILLS

C# / .NET

C# 13, .NET 9 / 10, ASP.NET Core Web API, Controllers, Minimal API, Middleware, hosted and background services, DI, Options pattern, async/await, CancellationToken, LINQ, records, source generators

API & AUTH

REST API design, versioning and DTO contracts, JWT access/refresh with rotation, Google OAuth / OpenID Connect, BCrypt, roles and claims, policy-based authorisation, API-key auth, rate limiting, request validation, global exception handling, Swagger/OpenAPI, SignalR real-time hubs

DATA

EF Core, code-first migrations, DbContext, Fluent API, change tracking, PostgreSQL / Npgsql, MySQL, SQLite, Redis, hand-written SQL, joins, indexes, transactions, isolation levels, query plans

ARCHITECTURE

Clean and layered architecture, CQRS with MediatR, repository and service patterns, domain entities and value objects, aggregate boundaries, SOLID, DRY, KISS

TESTING

xUnit, Moq, unit and integration testing, in-memory and substituted repositories, test-first on domain rules

DEVOPS & OBSERVABILITY

Docker, Docker Compose, GitHub Actions, GitLab CI/CD, Caddy / Nginx reverse proxy, VPS deploy and rollback, Serilog structured logging, health checks, Linux / Bash (Arch), SSH, Git, Postman, curl, pgAdmin, Rider, VS Code

FRONTEND

Working knowledge of React 19, TypeScript, Vite, TanStack Query and Tailwind — enough to build and debug the client that consumes my API

AI-ASSISTED DEV

Claude Code and OpenAI Codex in the daily loop — scaffolding, refactoring, test generation and code review; generated code is read and checked against project architecture before it is merged

LANGUAGES

Ukrainian — Native
English — B2

PROFILE

3+ years of backend development on C# and ASP.NET Core. I own services end to end: domain model, relational schema and migrations, REST API, authentication and authorisation, business-rule test coverage, containerisation and deployment to a live VPS. Primary stack: ASP.NET Core over PostgreSQL with EF Core and MediatR. 37k lines of C# in production, under 718 xUnit cases.

PROJECT EXPERIENCE

Shifter — Shift & Payroll Platform

6 months

Backend Developer · production REST API · github.com/4booser/Shifter

Shift planning and payroll for hourly-paid staff: schedules, real earnings with overtime, tips and deductions, analytics and payouts.

Stack **ASP.NET Core 10 · C# · EF Core 10 · PostgreSQL 17 / Npgsql · MediatR · JWT · BCrypt · Serilog · QuestPDF · Web Push · Swagger / OpenAPI · xUnit · Docker Compose · GitHub Actions · Caddy**

- **Architecture** — Clean Architecture across Domain, Application, Infrastructure and Api projects with dependencies pointing inwards; MediatR request pipeline over repository abstractions and DTO boundaries. 208 endpoints on 30 controllers, 64 entities, 99 EF Core migrations.
- **Data** — two DbContexts on separate PostgreSQL databases for business data and tokens; code-first migrations applied by a dedicated container gated on a database healthcheck, so the API can never start against a stale schema.
- **Domain** — payroll computed entirely server-side: ISO-week overtime scoped per workplace, weekly and monthly salary periods, tip-out, meal deductions, proportional split of tips and sales across workplaces, tax base and vacation accrual. Conditions are snapshotted onto the day, so editing a template never rewrites history. 718 xUnit cases over 92 files.
- **Security** — JWT access/refresh with rotation, Google ID-token sign-in, BCrypt hashing, rate limiting; identity resolved from claims only and never from the request body, uniform error contract across 400/401/403/404/409/429, with 404 on foreign resources to prevent enumeration.
- **Integrations** — token-scoped inbound webhooks typed as sales, hours or both, with a 50-entry delivery log and replay, so a leaked POS key cannot touch the schedule; QuestPDF reports, Web Push notifications, ICS and CSV/XLSX exchange.
- **Observability** — Serilog sinks, global exception middleware returning one envelope for every failure, health checks over both databases.
- **Delivery** — 4-service Docker Compose stack, GitHub Actions on every push, Caddy with automatic TLS, immutable tagged images shared by app and migrator, single-command rollback.

Cafe — Restaurant Back-Office API

8 months

Backend Developer · REST API · github.com/4booser/Cafe

Operations backend for cafe and restaurant chains: ownership hierarchy, staff and access, menus, orders, stock and recipe costing.

Stack **ASP.NET Core 9 · C# · EF Core · PostgreSQL / Npgsql · MediatR · JWT · BCrypt · Serilog · Swagger / OpenAPI · Twilio · Docker**

- **Domain** — 24 entities across 7 aggregates: company ownership, venues, staff with roles and permissions, menus, orders, shifts, warehouses with ingredients and technical cards for recipe costing.
- **Architecture** — layered API with MediatR commands and handlers, repository abstractions, DTO boundaries and structured response envelopes; 3 DbContexts with separate connection strings for business data, tokens and logs, migrated on startup.
- **Security & ops** — JWT Bearer with claims and access/refresh flow, permission-secured endpoints; global exception middleware, Serilog sinks, Swagger contract, Twilio SMS.

EDUCATION

Bachelor's Degree — Software Engineering (121)

National Transport University, Kyiv
